A quantum Turing machine based on a universal set of gates

- qubit: 2-level-system $|\psi\rangle = a|0\rangle + b|1\rangle$ resetable to $|0\rangle$
 - A few single qubit gates $U_1|\psi\rangle$
 - a 2-qubit entangling gate $U_2|\alpha_0, \alpha_1, \alpha_2, \alpha_3\rangle_{00,01,10,11}$
 - qubit readout with high fidelity
- } universal set

n qubits \rightarrow $N = 2^n$ basis states $\overbrace{|010001\dots 1\rangle}^n = |p\rangle$

Universal reversible **single-** and **two-qubit** gates arranged sequentially.

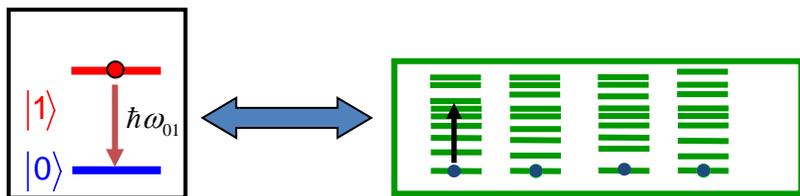

registre

$$|\psi\rangle = \alpha_0 |0, 0, \dots, 0\rangle + \alpha_1 |1, 0, \dots, 0\rangle + \dots + \alpha_{2^n - 1} |1, 1, \dots, 1\rangle$$

Relaxation (spontaneous emission)

qubit j

environnement

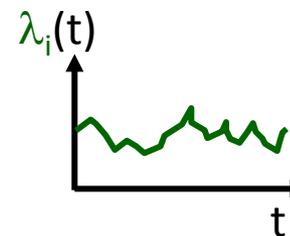

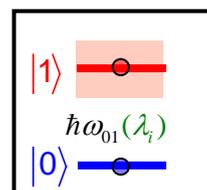

$|1\rangle_j$

$$T_1^{-1} = \Gamma_1$$

Pure dephasing

low-frequency noise

$$a|0\rangle_j + be^{i\varphi(t)}|1\rangle_j$$

low-frequency noise

$$\Gamma_\varphi$$

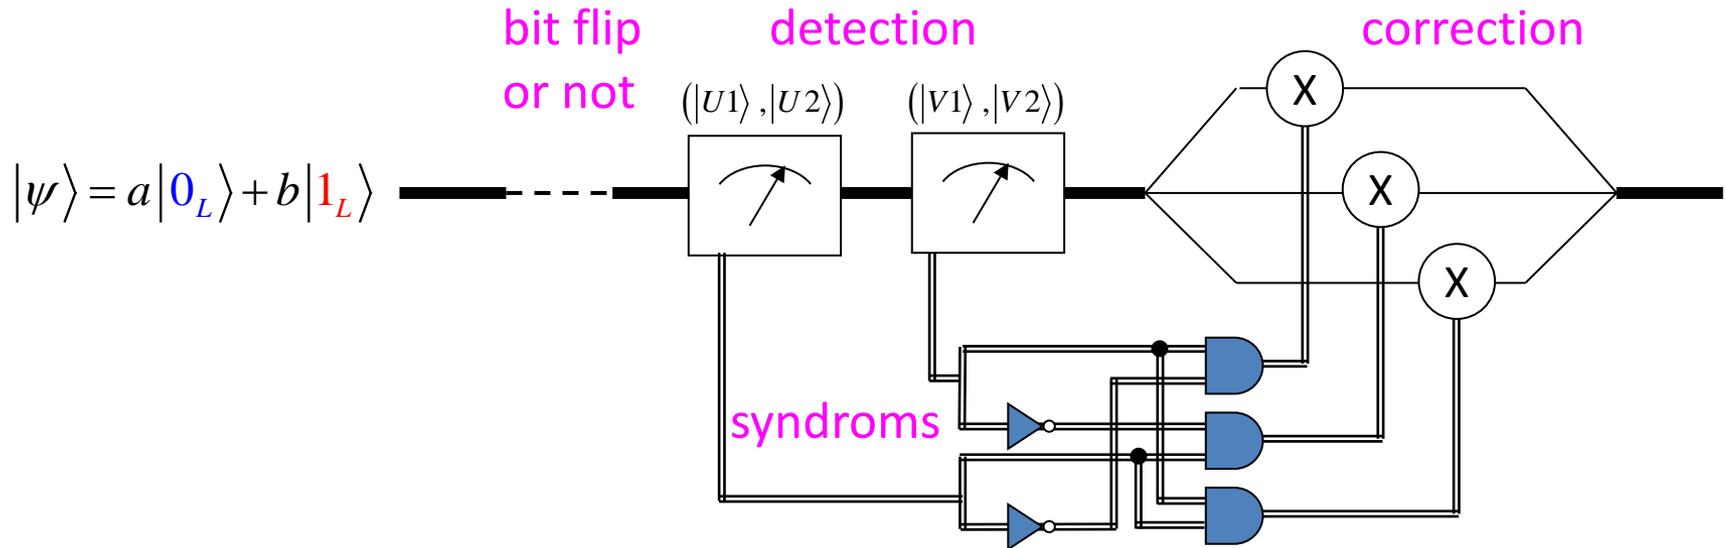

$$\langle e^{i\varphi(t)} \rangle \approx e^{-\Gamma_2 t}$$

$$T_2^{-1} = \Gamma_2 = \Gamma_\varphi + \frac{\Gamma_1}{2}$$

Use redundancy (despite non-cloning)

Example: relaxation (bit-flip) correction

$$(|0_L\rangle, |1_L\rangle) = (|000\rangle, |111\rangle)$$

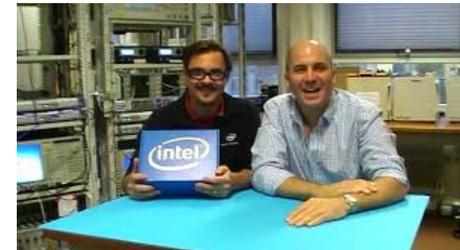

Works if error/gate < certain threshold.

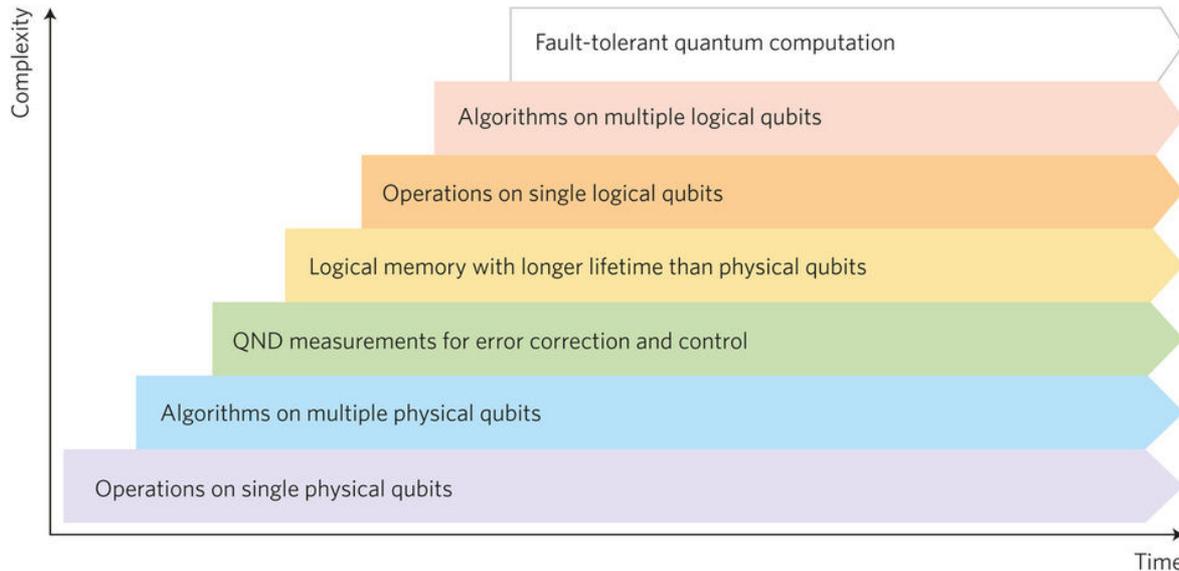

For « surface code », threshold < 1%

What could be done with a quantum computer ?

- Search and optimization problems (Grover, ...)
- Factorization of large numbers (Shor)
- Find the energy spectrum of molecules

Big industrial investments ongoing

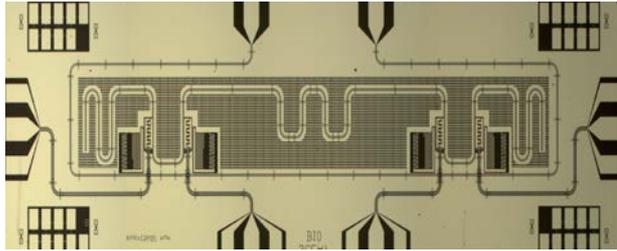

R. Schoelkopf & M. Devoret,
Nature (2013)

Experimental

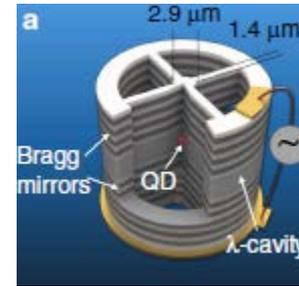

- Improve coherence time of existing qubits
- Find best physical platform
- Improve the accuracy of gates and qubit readout

Theoretical (see talk by E. Kashefi)

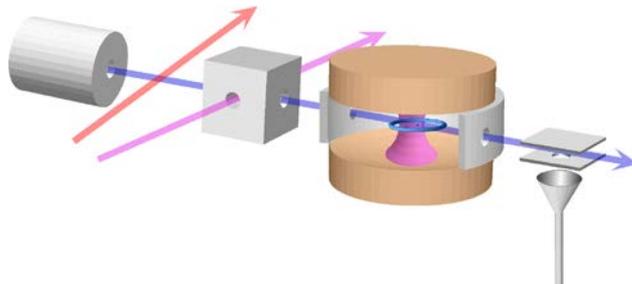

- Improve/Find new Quantum Error Correcting codes (less overhead needed)
- Explore Quantum Error Correction under more realistic noise models
- Explore « small-scale » implementations with realistic numbers of qubits, of gates, and of qubit control accuracy
- Find new algorithms

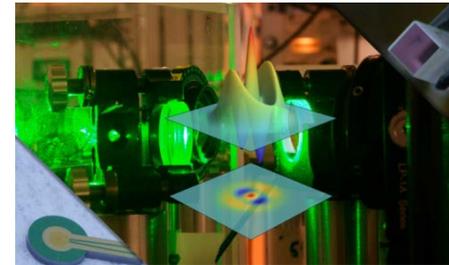

Superconducting circuits

Semiconducting quantum dots in a microcavity

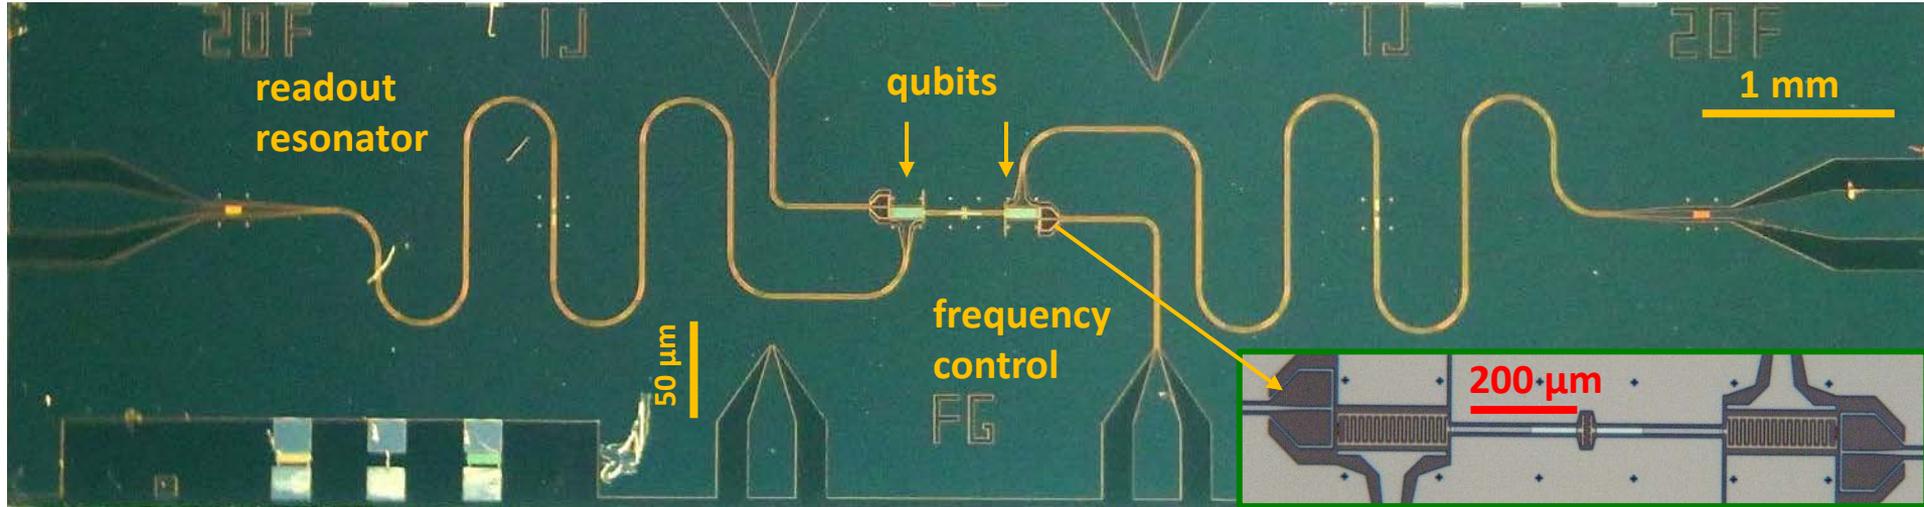

Rydberg atoms coupled to microwave cavity

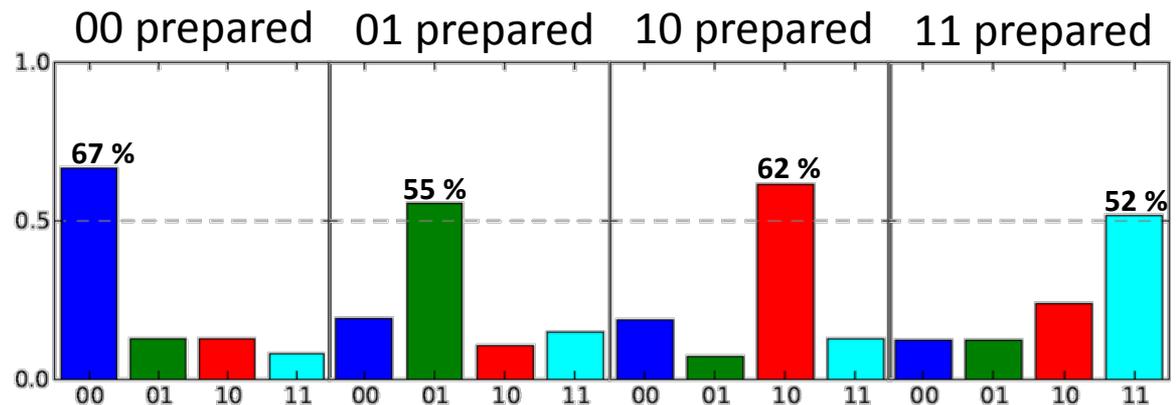

Photonic quantum states

A. Dewes et al., PRL (2011)
A. Dewes et al., PRB (2011)

Quantronics group, SPEC, CEA Saclay

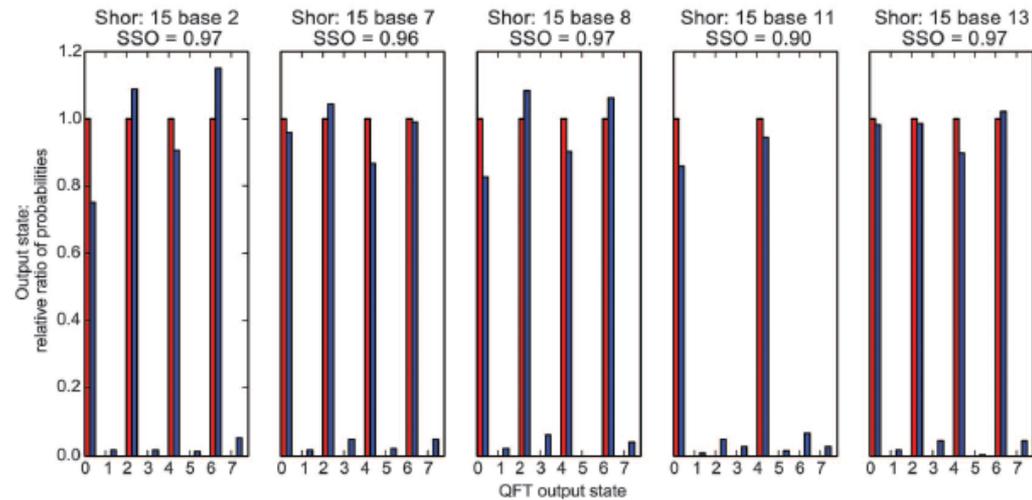

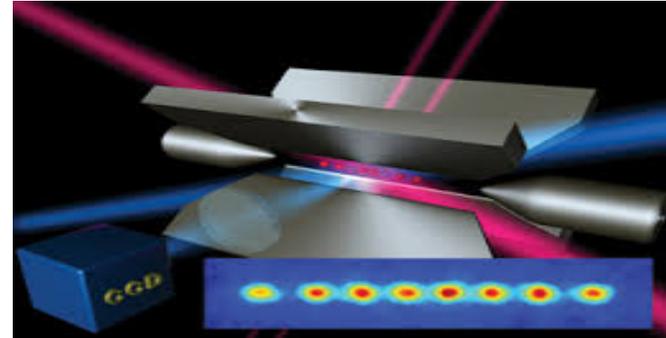

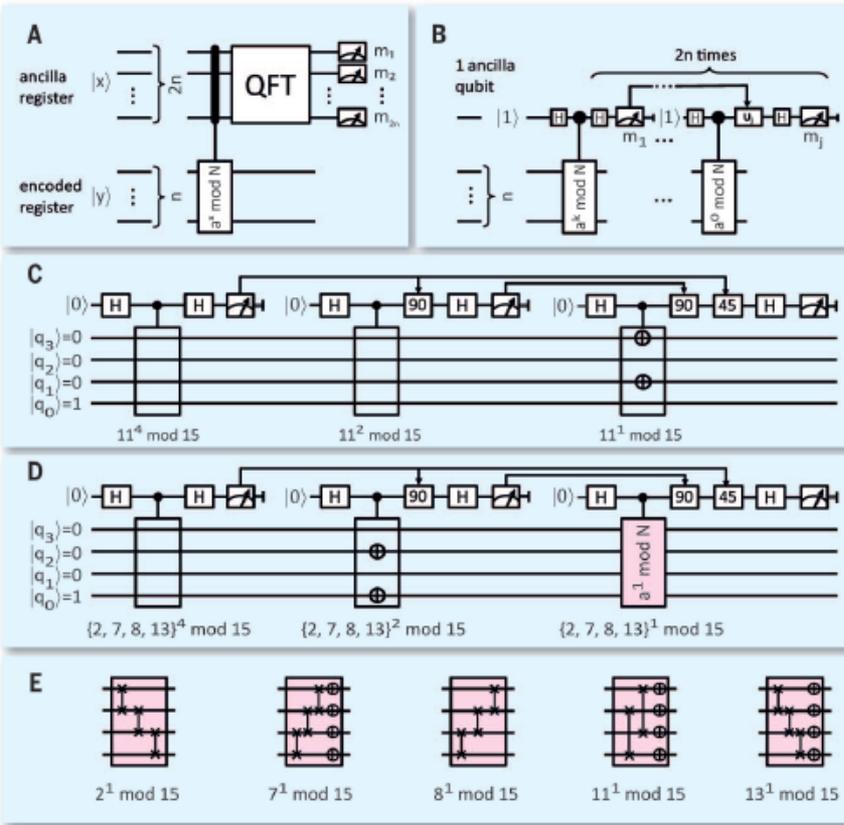

Two-transmon processor
+ quantum speedup
in Grover search
algorithm

In one run of the experiment, the success rate is larger than the largest possible classical success rate of 50% : **QUANTUM SPEEDUP**

T. Monz et al., Science 2016 (R. Blatt's group)

Correct factoring of 15 with 99% probability

- Despite recent advances, remain major experimental and theoretical challenges to tackle before interesting problems can be treated by quantum processors, with or without Quantum Error Correction
- SIRTEQ will provide strong incentive to join experimental and theoretical efforts, which are key to future breakthroughs
